ABSTRACT

[0064]   Methods and apparatus for providing separable billing services.   In one embodiment, an apparatus comprises a memory for storing a data address associated with a first type of communication and a processor for receiving a data packet, the data packet comprising a destination data address.   The processor compares the destination data address to the data address associated with the first type of communication, and routes the data packet to the destination data address if the destination data address matches the data address associated with the first type of communication and bills an account associated with the first type of communication.
